Profile

Senior Backend Engineer with 7+ years of experience designing scalable, distributed, and high-throughput systems. Specialized in Java, Spring Boot, event-driven architectures, and AWS cloud environments, delivering resilient enterprise solutions with high code quality and Domain-Driven Design.

Experience

Senior Backend Software Engineer — Sportingtech Sofia, Bulgaria (Remote) Feb 2026 – Present
Lead backend engineering initiatives for a high-scale white-label iGaming platform, delivering regulatory compliance engines, fraud prevention workflows, and multi-region market expansion using Java 21, Spring Boot, and RabbitMQ.

- Integrated automated KYC and identity verification providers (Sumsub, Legitimuz) into user registration flows, mitigating automated bot traffic and ensuring seamless onboarding security.
- Engineered core responsible gaming modules enforcing strict loss thresholds and session-duration limits, ensuring compliance with federal gaming mandates across white-label tenants.
- Developed automated Slack incident alerting and monitoring around batch processing jobs validating government-restricted individuals (SIGAP), drastically reducing triage response times for compliance issues.

Senior Software Engineer — Itaú Unibanco Sao Paulo, Brazil (Hybrid) Mar 2025 – Feb 2026
Architected and scaled cloud-native microservices for Itaú's flagship customer loyalty program ("Mais Vantagens"), leveraging modern Java, AWS services, and event-driven data streaming.

- Engineered and maintained 4 mission-critical Java microservices to orchestrate customer loyalty rewards, scaling the platform to over 100k active users within one year while processing 500k+ monthly benefit distributions.
- Designed robust event-driven workflows utilizing Apache Kafka, AWS SQS, and API Gateway on AWS ECS, ensuring sub-second response times and high fault tolerance across distributed services.
- Implemented a polyglot persistence strategy using AWS DynamoDB for low-latency operational state retrieval and AWS RDS for relational transactional consistency, paired with AWS Glue ETL jobs for analytical reporting.
- Established comprehensive observability and proactive tracing using Datadog, optimizing system bottlenecks, maintaining SLA adherence, and driving operational resilience.

Senior Software Engineer — Unico IDTech Sao Paulo, Brazil (Remote) Apr 2021 – Mar 2025
Led end-to-end engineering initiatives for core digital identity and onboarding products (Unico People, Unico Sign), architecting scalable microservices with Golang, Angular, GCP, MongoDB, and Redis.

- Led the modernization of the document analysis engine, migrating legacy Angular 5 on GKE to a high-performance architecture, boosting system throughput by 35% and unlocking R$950k in new annual recurring revenue (ARR) via premium tier segregation.

- Architected from scratch "mysign", a tamper-proof digital signature management platform capturing critical forensic audit trails, including facial biometrics and geolocation metadata to ensure document authenticity.
- Automated bank account verification workflows using Transfeera micro-deposits, eliminating payment failure incidents, reducing support tickets, and ensuring zero-touch recipient account validation.
- Engineered automated proof-of-address verification pipelines for candidate onboarding, eliminating manual data entry, accelerating approval rates, and cutting operational review overhead.
- Conducted technical and behavioral interview loops resulting in 6 successful engineering hires, while mentoring peers and earning multiple annual Quality and Merit Recognition awards.

Software Engineer — Santander Brasil Sao Paulo, Brazil May 2019 – Apr 2021
Engineered digital onboarding platforms and modernized mission-critical ATM banking infrastructure using Java 11, Angular, OracleDB and DB2.

- Core engineer on the flagship digital onboarding platform ("Abra Sua Conta"), scaling the solution to exceed 3+ million new customer account openings.
- Modernized legacy ATM architecture by migrating mission-critical mainframe COBOL systems to a robust Java 11 microservices and Angular stack, significantly lowering maintenance overhead and boosting transaction speed.
- Integrated APM observability tooling (Dynatrace) and enterprise DB2 relational data workflows to monitor real-time banking transactions and optimize system availability.
- Received the standout ATM Engineering Award for exceptional impact and technical contributions to modernizing ATM self-service software.

Software Engineering Intern — ABTRA - Brazilian Association of Terminals and Bonded Warehouses Santos, Brazil Nov 2017 – May 2019
Maintained legacy port logistics software and engineered data integration APIs and BI reporting pipelines using ASP.NET, VB6, and relational databases.

- Engineered RESTful backend APIs in ASP.NET to process and deliver real-time container throughput metrics, origins, and destinations across the Port of Santos.
- Built automated ETL workflows and BI reporting pipelines delivering trade statistics, cargo volumes, and bilateral trade indicators directly to port authorities and government agencies.
- Maintained and improved mission-critical legacy desktop systems in Visual Basic 6 (VB6), optimizing SQL queries to streamline data retrieval for port logistics.

Education

B.S. Information Systems Catholic University of Santos Jan 2016 – Dec 2019

Skills

Languages English (Full Professional Working Proficiency), Portuguese (Native)
Backend & Core Languages Java (8, 11, 17, 21), Go (Golang), Spring Boot, Spring Cloud
Databases & Storage PostgreSQL, MongoDB, DynamoDB, Redis, Oracle DB
Observability & Engineering Practices Datadog, Dynatrace, New Relic, Sentry, CI/CD, Git, Unit & Integration Testing
Frontend TypeScript, JavaScript, Angular, React.js

Projects

Sukiyaki Event Management Platform
Full-stack event management and real-time ticketing platform handling table reservations and digital media galleries for a cultural festival.
Distributed Locking, Concurrency Control, Race Condition Mitigation, REST APIs, Cloud Storage, PostgreSQL / Redis

- Architected a high-concurrency seat reservation engine, implementing optimistic/pessimistic locking mechanisms to eliminate race conditions and prevent double-booking during peak traffic.
- Built a digital media gallery module enabling automated photo processing, secure upload workflows, and low-latency asset delivery for attendees.

Confirm Your Presence (RSVP SaaS)
Modern guest management and RSVP web application designed to streamline wedding attendee confirmations and seating logistics.
SaaS Architecture, Event-Driven Notifications, REST APIs, Cloud Hosting, Clean Architecture

- Developed an automated guest confirmation platform supporting real-time RSVP tracking, guest-list status analytics, and automated notification triggers.
- Designed an intuitive self-service portal handling dynamic plus-one validations and dietary/attendance data collection with high mobile responsiveness.
